Mode: allch

Report location: C:\Users\lenin\Documents\GitHub\pipeline-eeg-eda_060524\reports\svm_classification_report_allch_20250611093846.pdf

This report summarizes the results of SVM-based classification of EEG/EDA data. The pipeline includes class balancing (SMOTE), feature selection (RFE), and hyperparameter tuning (GridSearchCV). Selected features and SVM hyperparameters are listed above. Performance metrics (accuracy, F1, precision, recall), confusion matrix, and ROC curve are provided. Interpretation: Higher accuracy and F1 indicate better discrimination between classes. Feature selection helps focus the model on the most informative EEG/EDA features. Hyperparameter tuning ensures optimal SVM performance. Review the confusion matrix and ROC curve for detailed class-wise performance.
